Pt. Age:	75 years.	Gender:	Male	Received date:	2026-04-02
Referred By:	د/ مهند السالم		Reported date:	2026-04-05	

PATHOLOGY REPORT

Clinical Information.	The patient presents with epigastric pain and a history of <i>H. pylori</i> -associated antral gastritis diagnosed two months prior, with a current follow-up gastroscopy revealing persistent antral gastritis for which repeat biopsies have been taken.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa body type showing mild atrophy of glands and mild infiltration by lymphocytes and plasma cells. Few neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are not identified. No evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- Mild chronic atrophic gastritis with minimal inflammatory activity.
- Negative for atypia and malignancy.
