PATHOLOGY REPORT

Clinical Information.	Poypoid mass at the pee hepatic flexure, previouly diagnose on biopsy adenocarcinoma grade 2 (pathology number 1702-2026 on 2026-03-18).
Nature of specimen.	Right hemicolectomy.

GROSS:

Two specimens were received;

1- Right hemicolectomy: including a 10 cm length of terminal ileum, a 5 cm appendix, and a 35 cm segment of cecum and ascending colon. Attached omentum measured 20 x 12 x 1 cm, and the mesenteric fat measured 22 x 5.5 x 2 cm. Opening revealed a solid, firm, creamy-colored mass measuring 3x 2.8 x 2.8 cm. Tumor was located 25 cm from the proximal surgical margin and 14 cm from the distal surgical margin. Dissection of the mesenteric fat yields 22 lymph nodes, the largest measuring 1.5 cm in greatest dimension.

2- Small biopsy taken from the pelvic region: fragment of fatty soft tissue was received, measuring 1.3 x 1 cm, totally embedded.

MICROSCOPIC:

Procedure: Right hemicolectomy.

Tumor site (anatomic location): Hepatic flexure.

Tumor focality: Single

Tumor size (largest dimension): 30 mm

Histologic type: Adenocarcinoma.

Histologic grade: Moderately differentiated (G2).

Depth of invasion: 28 mm

Anatomic extent:

- Invades pericolic fat (pT3)

Margins:

- Proximal margin: negative; distance to tumor 250 mm.
- Distal margin: negative; distance 140 mm.

Lymphovascular invasion (LVI): Not identified.

Perineural invasion (PNI): Not identified.

Tumor deposits: absent.

Tumor budding: absent.

Regional lymph nodes:

- Number examined: 19

- Number positive: 0

pTNM stage: pT3N0Mx

Additional note: Pelvic biopsy is negative for tumor deposits.

DIAGNOSIS:

Hepatic flexure mass, Rt. Hemicolectomy:

- Adenocarcinoma, grade 2 .
- Regional lymph nodes are (0/19) negative for metastasis.
- Margins of excision are free of tumor.
- Pelvic biopsy is negative.
- TNM stage T3N0Mx
