PATHOLOGY REPORT

| | |
|------------------------------|--|
| Clinical Information. | History of headache and left eye pain has a large avidly enhancing suprasellar and left parasellar extra-axial mass—highly suggestive of a meningioma—that encases the left internal carotid artery, compresses the optic chiasm and left optic nerve, and causes an 8 mm rightward midline shift with subsequent active asymmetric obstructive hydrocephalus. |
| Nature of specimen. | Excision biopsy |

GROSS:

Soft tissue fragments collectively measured 1.3x1 cm, totally embedded.

MICROSCOPIC:

Multiple sections show cellular meningeal tumor formed of plump spindle meningeal cells with indistinct cellular borders and focally arranged in whorly patterns with many small onion-bulb structures and some psammoma bodies. No evidence of malignancy. This is a WHO grade I meningioma.

DIAGNOSIS:

Suprasellar and left parasellar extra-axial mass, excision biopsy:

- Transitional meningioma, WHO grade I.
- Negative for malignancy.
