PATHOLOGY REPORT

Clinical Information.	The patient presents with a painful hyperkeratotic papule on the right foot that has been present for 8 months.
Nature of specimen.	Incision biopsy

GROSS:

Two soft tissue fragments partially covered by skin measuring 1.5x1x0.8 cm, totally embedded.

MICROSCOPIC:

Sections show skin with marked hyperkeratosis. The underlying dermis contains extensive, irregular, deeply basophilic, and fragmented deposits of amorphous material consistent with calcium, embedded within a dense fibrous stroma. No evidence of specific organism. No evidence of atypia or malignancy in submitted material.

DIAGNOSIS:

Foot skin lesion, incision biopsy:

- Calcinosis cutis.
- Negative for malignancy.
