PATHOLOGY REPORT

Clinical Information.	History of hemoptysis and a hard, painless left supraclavicular mass is suspected of having a gastric primary tumor after an upper endoscopy revealed a small raised lesion in the gastric corpus
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two soft tissue fragments collectively measured 0.4 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing moderate infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by neutrophils infiltrating glands. *H. pylori* characteristic forms are seen. No evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- *H. pylori* associated chronic gastritis with associated moderate inflammatory activity.
- Negative for dysplasia or malignancy.
