PATHOLOGY REPORT

Clinical Information.	Congested and hyperemic antral mucosa with granular pattern.
Nature of specimen.	Endoscopic Biopsy.

GROSS:

Soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing mild atrophy of glands and moderate infiltration by lymphocytes and plasma cells. Some neutrophils are seen infiltrating glands indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated mild chronic atrophic gastritis with associated minimal activity.
- Negative for intestinal metaplasia
- Negative for dysplasia.
- Negative for malignancy.
